Key words and phrases. New York City Taxi Trip Duration Prediction.

1. INTRODUCTION

This project required to build a model that predicts the total ride duration of taxi trips in New York City. The primary dataset is one released by the NYC Taxi and Limousine Commission, which includes pickup time, geo-coordinates, number of passengers, picktime and dropoff time, and several other variables.

In this section, The train data which we have 1458644 Rows and 11 columns. The test data which we have 625134 Rows and 9 columns.

We built the linearregression model, using distance to predict the trip duration and test.

2. DATA ETL

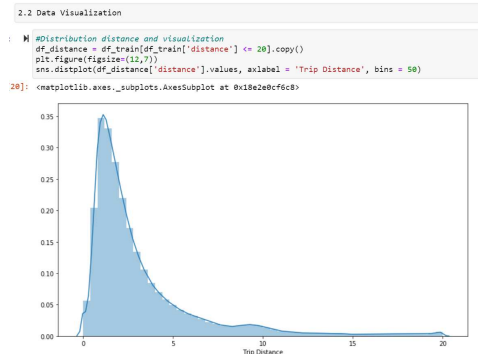

- Read train data and test data from csv files.
- After we read, clean the data and check NAs, The train data which we have 1458644 Rows and 11 columns. The test data which we have 625134 Rows and 9 columns. We built the linearregression model, using distance to predict the trip duration and test.
- Data Types

Attribute	Description
vendor id	a code indicating the provider associated with the trip record
pickup datetime	date and time when the meter was engaged
dropoff datetime	date and time when the meter was disengaged
pickup longitude	the longitude where the meter was engaged
pickup latitude	the latitude where the meter was engaged
dropoff longitude	the longitude where the meter was disengaged
dropoff latitude	the latitude where the meter was disengaged
store and fwd flag	Y=store and forward; N=not a store and forward trip
trip duration	duration of the trip in seconds

3. KNOWLEDGE DISCOVERY

Visualise Data:

- Distance characteristic analysis
- Distance characteristic analysis

4. SELECT FEATURES AND GROUPBY DATA

: Select 'trip duration' and 'distance' as features, groupby data to train data and test data in the train dataframe, set 0 to 150 as train data, 150 to 180 as test data

```

#groupby data to train data and test data in the train dataframe
df=data_train
train = df[:150]
test = df[150:180]
train

```

```

]:

```

	trip_duration	distance
0	455	1.498521
1	663	1.805507
2	2124	6.385098
3	429	1.485498
4	435	1.188588
...
145	972	2.211689
146	318	1.136076
147	625	1.897957
148	859	2.304592
149	141	1.578737

150 rows × 2 columns

5. BUILT MODELING AND PREDICT RESULT

Model:: LinearRegression Model

RSMLE:: 4.616529350404572

6. VISUALIZE PREDICT RESULT

- Trip Duration Visualize Predict Result

7. CONCLUSIONS

The Propose of this project which is to find the data features, select the attri-
 buates to build the linearregression model, find the best parameter using distance
 data to predict the trip duration and test.But , from the chart we can see the model
 is not very good, maybe we an explore other model to improve the accuracy.
